

COMPONENT-BASED MODELING OF COMPLETE BUILDINGS

Luc Leblanc Jocelyn Houle Pierre Poulin

Dept. I.R.O.
Université 
de Montréal

Graphics Interface
St. John's, May 25-27, 2011

GOALS

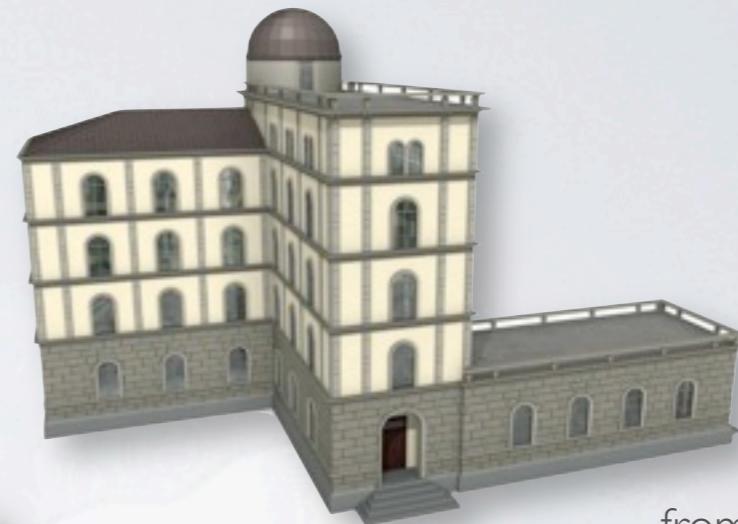

- Procedural generation of buildings
- Exteriors and interiors
- Complete control over the results
- High quality geometry

WHAT IT IS NOT

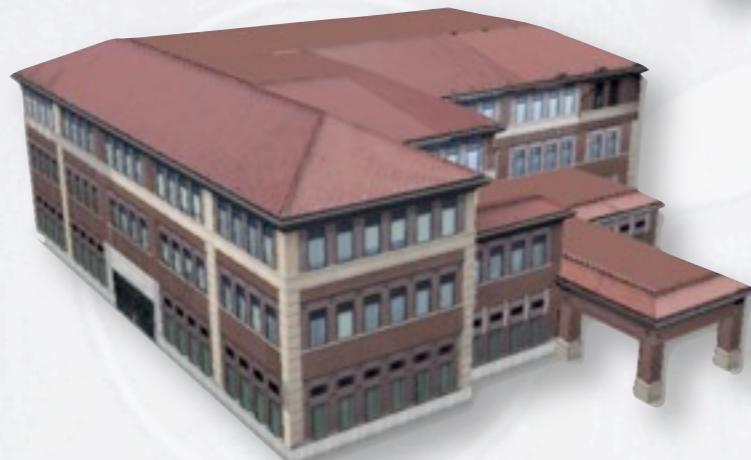

- Not a system for architects
 - although if they can program...
- Not a system to explore designs
 - although if they like looking at some random aspects...
- Not a library of functionalities
 - more like a special language with regular language concepts (variables, loops, randomness, etc.)

PREVIOUS WORK

- Mostly façades and building shapes
 - Shape/split grammars
- 3D Reconstruction
 - photos
- Floor plans
 - optimization

from Müller et al.

from Aliaga et al.

from Merrell et al.

CHANGES

- Linear order of execution of rules
- Rules become statements with queries
- A symbol becomes a component
 - persistency
 - inheritance
- Operation execution
 - applied on any subset of components
 - applied individually or on all components

CONCEPTS

- Components
 - spatially and semantically define elements
 - organized in tree(s)
- Program
 - statements formed by queries and operations
- Geometry
 - attached to some components
 - created from some components

COMPONENT

- 2D or 3D boundary with a bounding box
- Labels
- User attributes
- Child components
- Regions
- Connector

PROGRAM

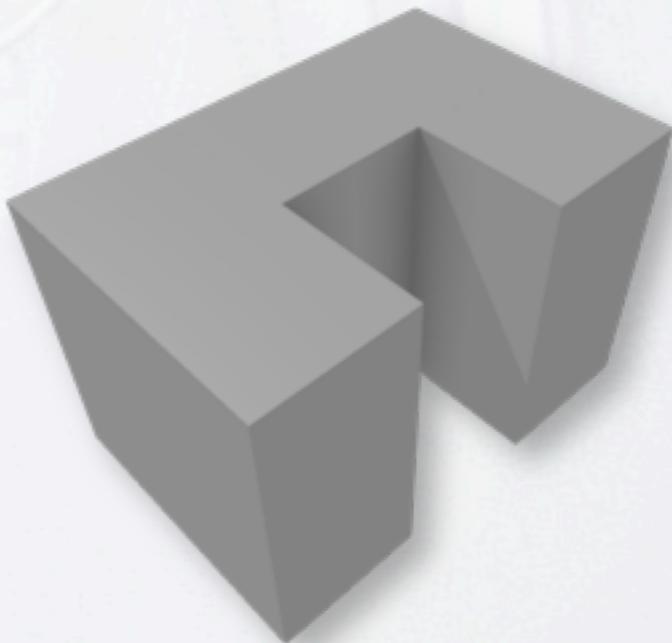

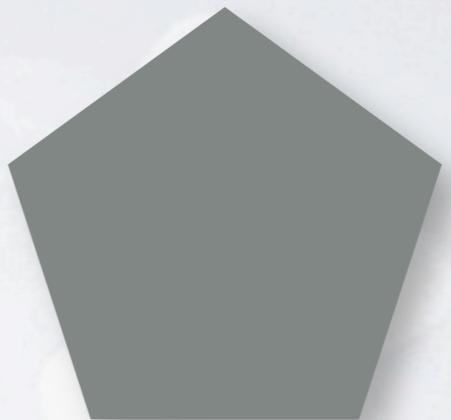

- List of statements
 - queries
 - conditions
 - operations
- for c in query (« label1 ») do
 - operation1 (c, ...)
 - operation2 (c, ...)
 - ...
 - end
- operation (query (« label1 »), ...)
- for c in query (« label1 ») do
 - operation (c, query (« label2»), ...)
 - end

QUERY

- Subset of elements
 - components
 - faces
 - regions
- Conditions
 - labels
 - attributes
 - visibility

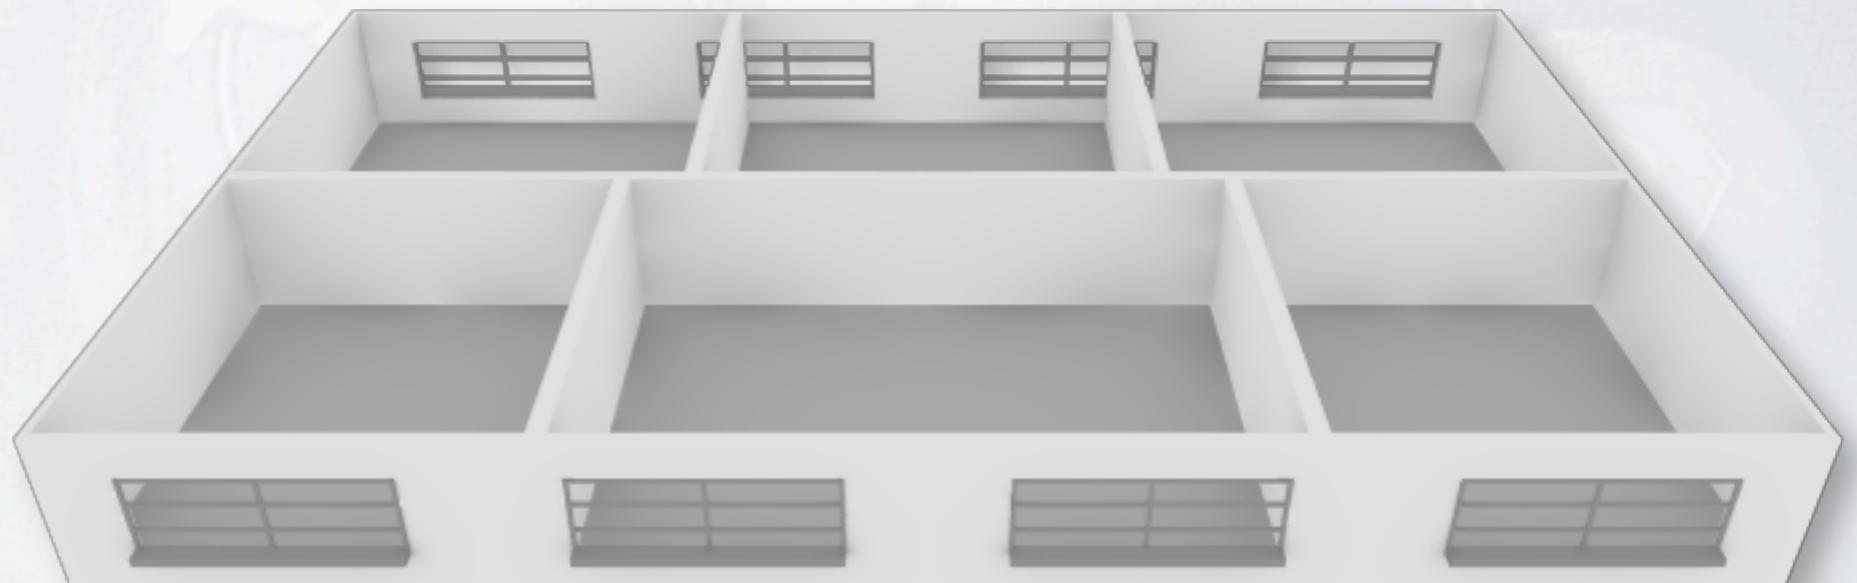

OPERATIONS

- Creation
- Split and slice
- Boolean
- Extrusion
- Connection
- Geometry

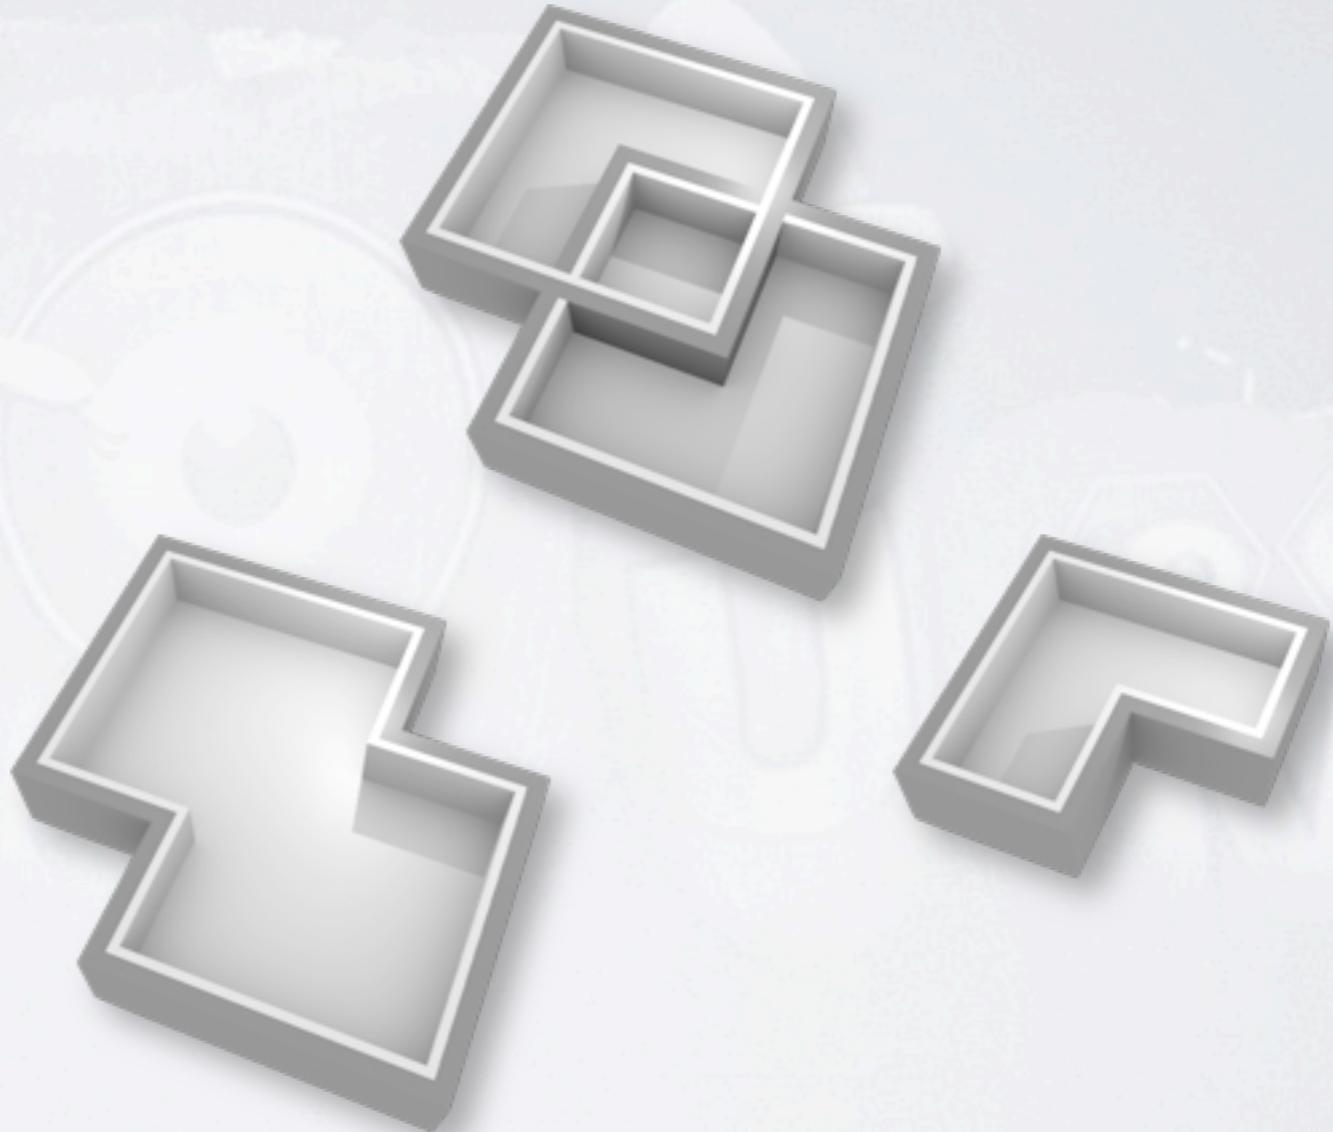

OPERATIONS

- Creation
- Split and slice
- Boolean
- Extrusion
- Connection
- Geometry

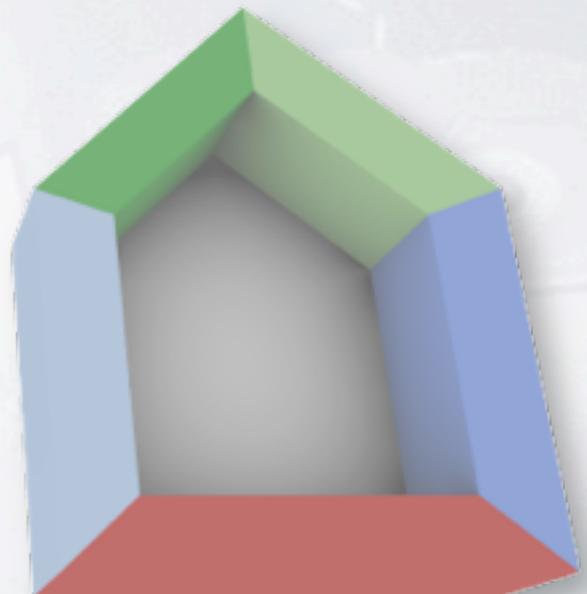

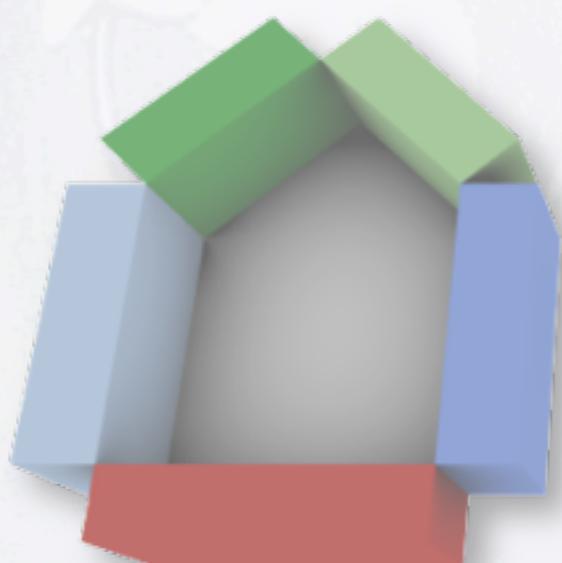

OPERATIONS

- Creation
- Split and slice
- Boolean
- Extrusion
- Connection
- Geometry

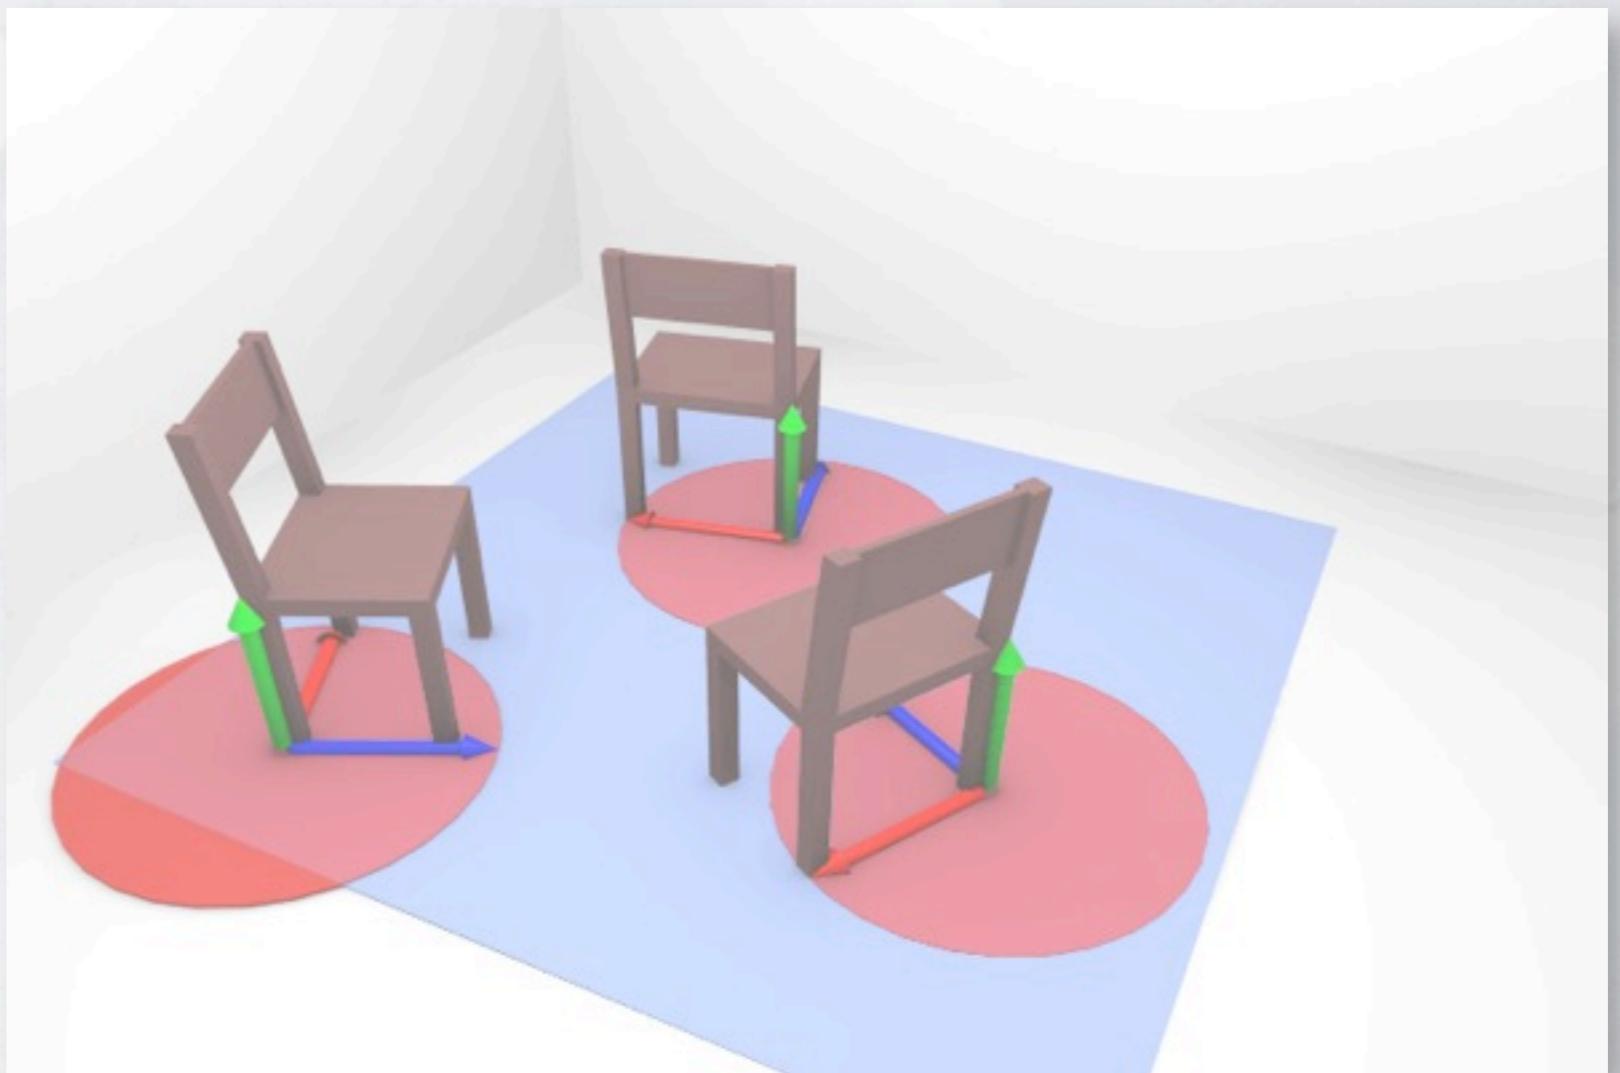

OPERATIONS

- Creation
- Split and slice
- Boolean
- **Extrusion**
- Connection
- Geometry

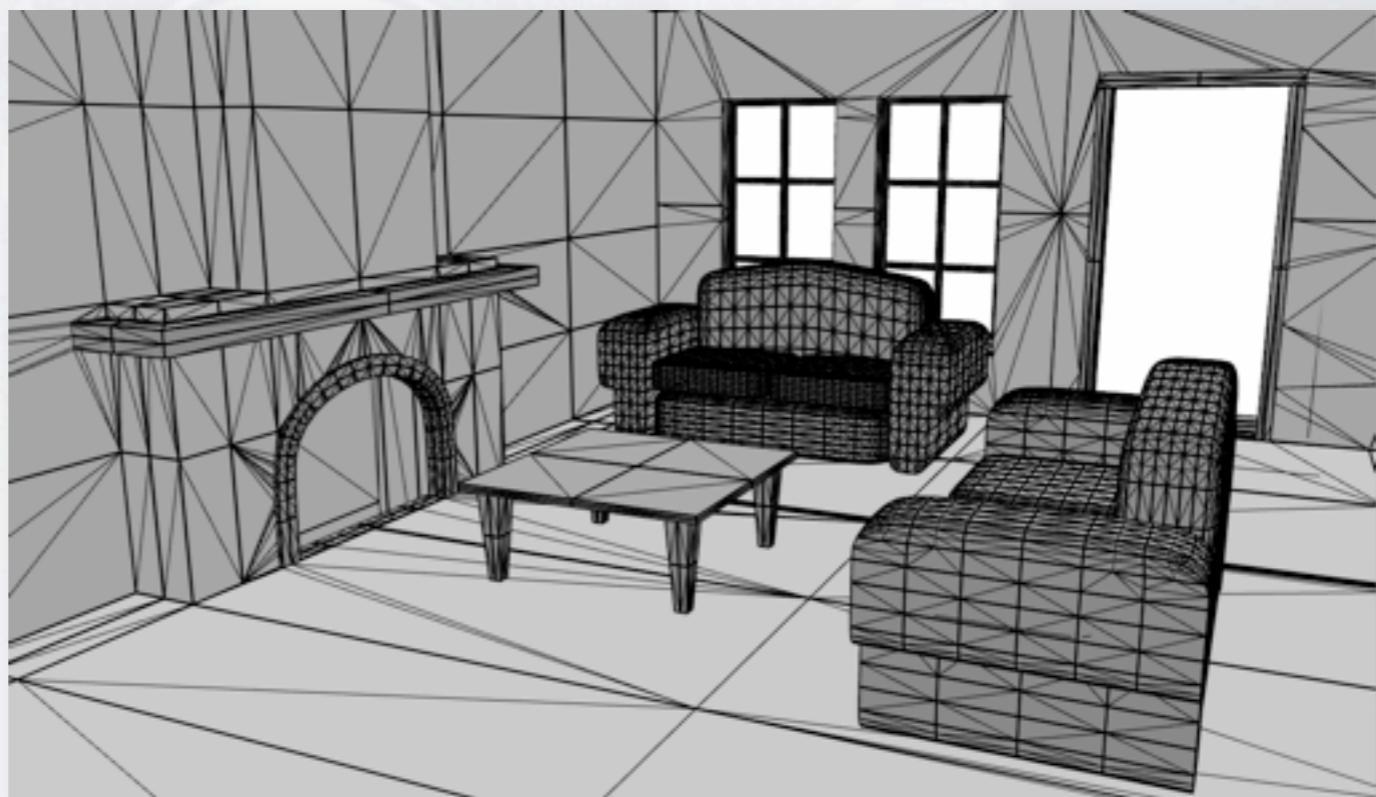

OPERATIONS

- Creation
- Split and slice
- Boolean
- Extrusion
- Connection
- Geometry

OPERATIONS

- Creation
- Split and slice
- Boolean
- Extrusion
- Connection
- Geometry

BUILDINGS

- Space partitioning
 - building shape
 - subdivision into rooms
- Base geometry
 - walls, floors and ceilings
- Architectural elements
 - doors, windows, staircases, balconies, ...
- Furniture, decorations

-- Main subdivision

```
component{ label="main", size={10,5,10}, color=1 }

for c in query( "main" ) do
    slice( c, "Y", { label="story", 2.5, level=count() } )
end

for c in query( "story" ) do
    split( c, "Z", { label="living space", rel=2 },
          { label="corridor", color=2, abs=2 },
          { label="living space", rel=2 } )
end

for c in query( "living space" ) do
    split( c, "X", { label="apartment", rel=1 },
          { label="apartment", rel=1 } )
end

component{
    label={"elevator", "room"}, size={2,5,2}, position={4,0,2},
    color=3
}
```

-- Priorities.

```
for c in query( "apartment" or "corridor" ) do
    subtract( c, query( "elevator" ), { label="room" } )
end
```

-- Frames

```
for c in query( "room" ) do
    for f in fquery( c, "SIDE" ) do
        component{ c, label="wall", boundary=f }
    end
    for f in fquery( c, "BOTTOM" ) do

RESULTS

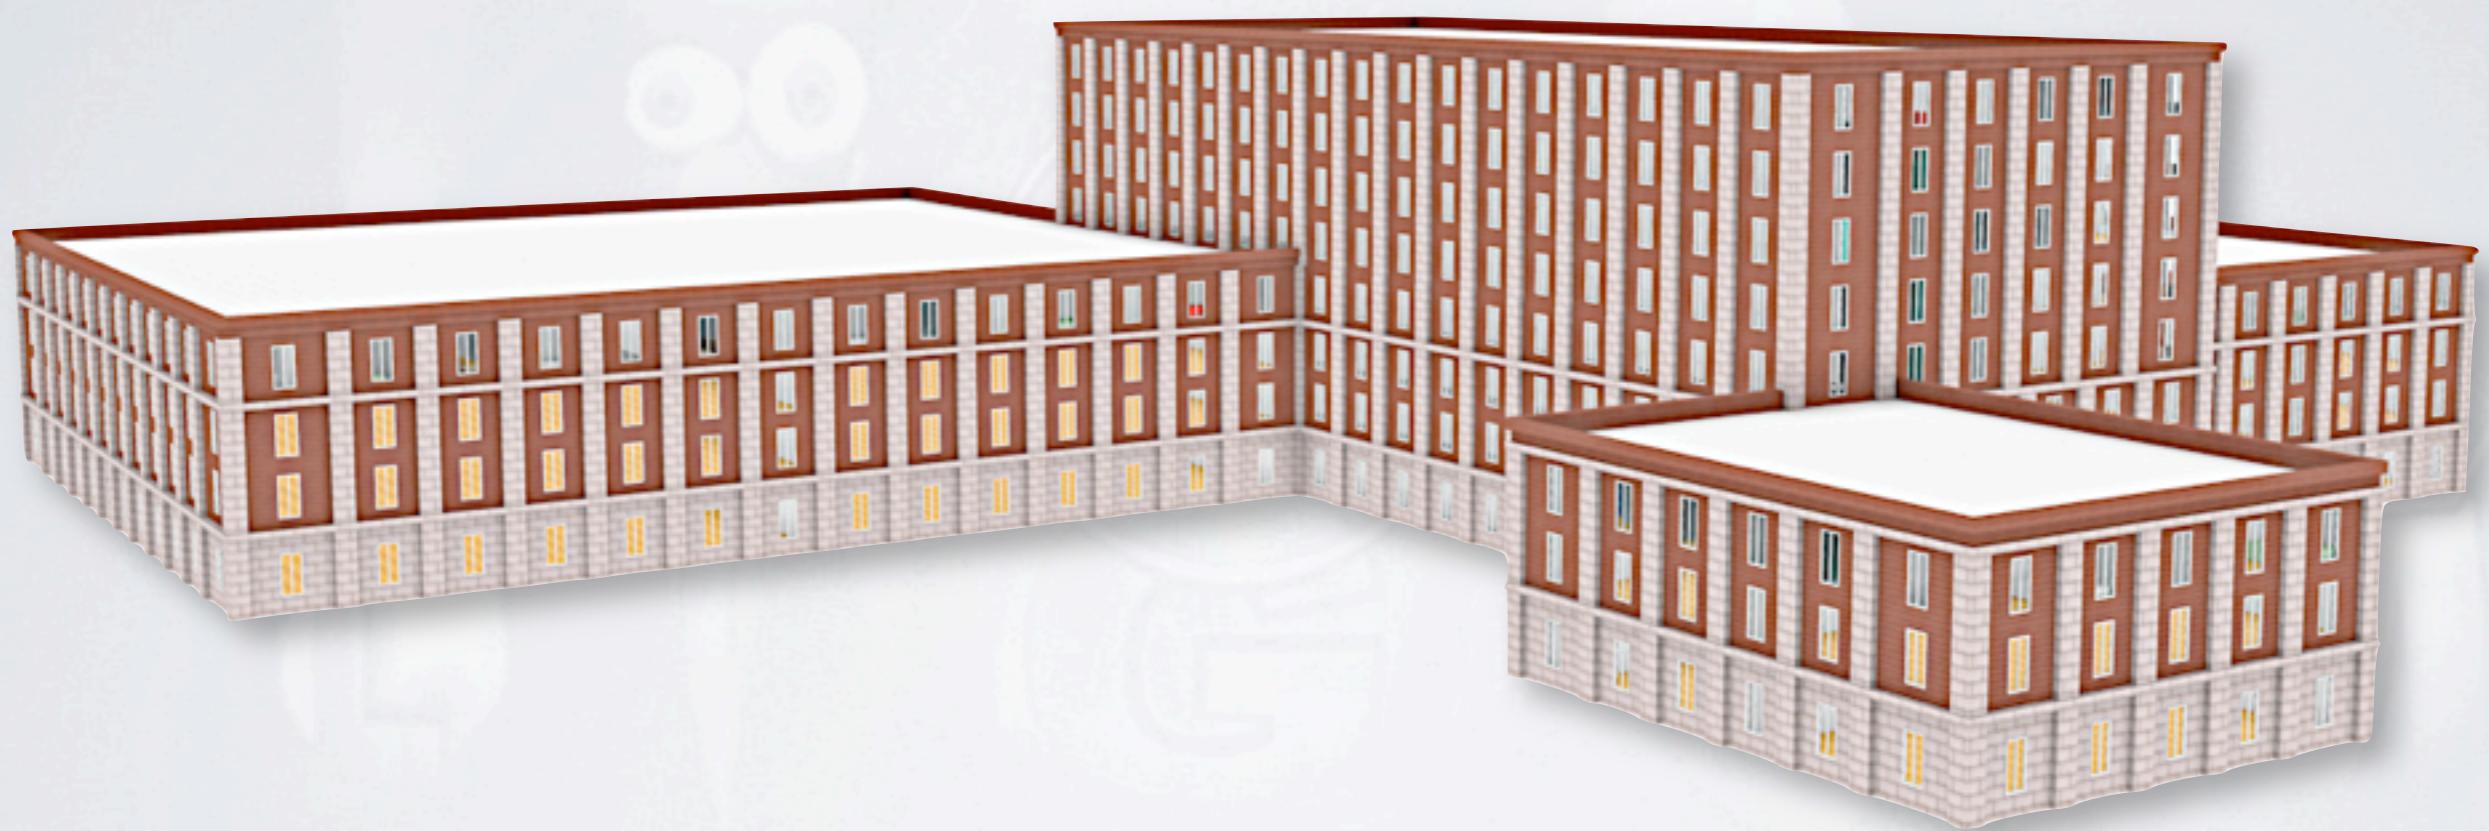

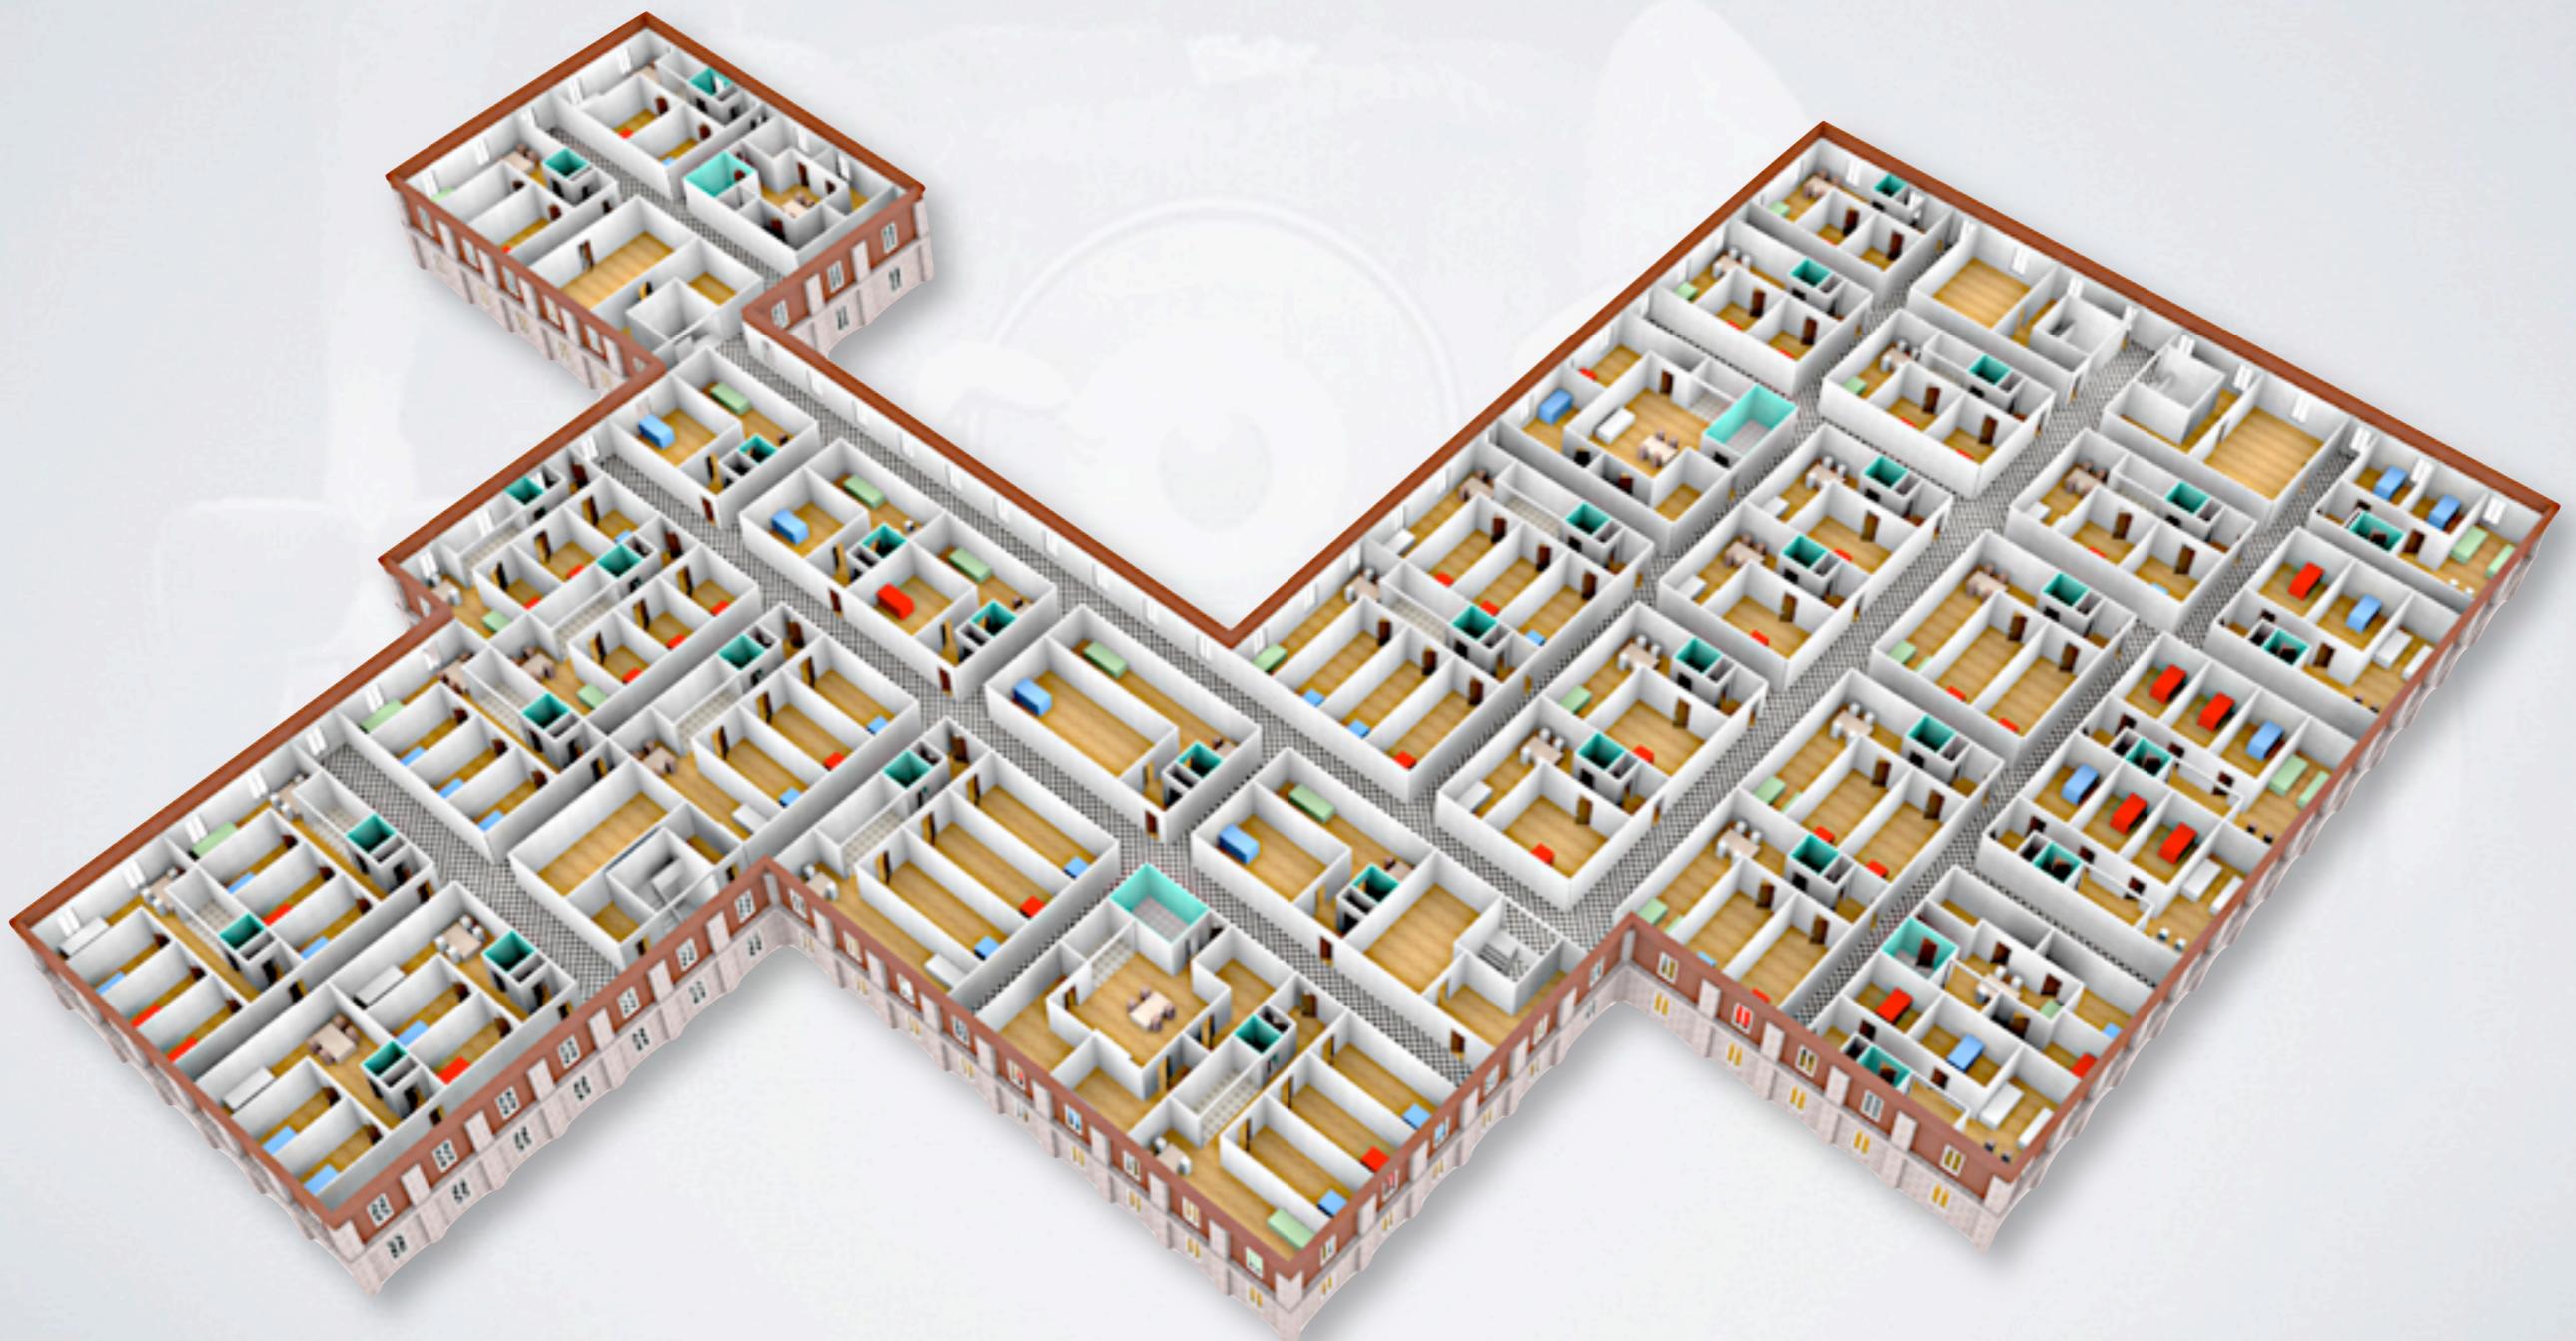

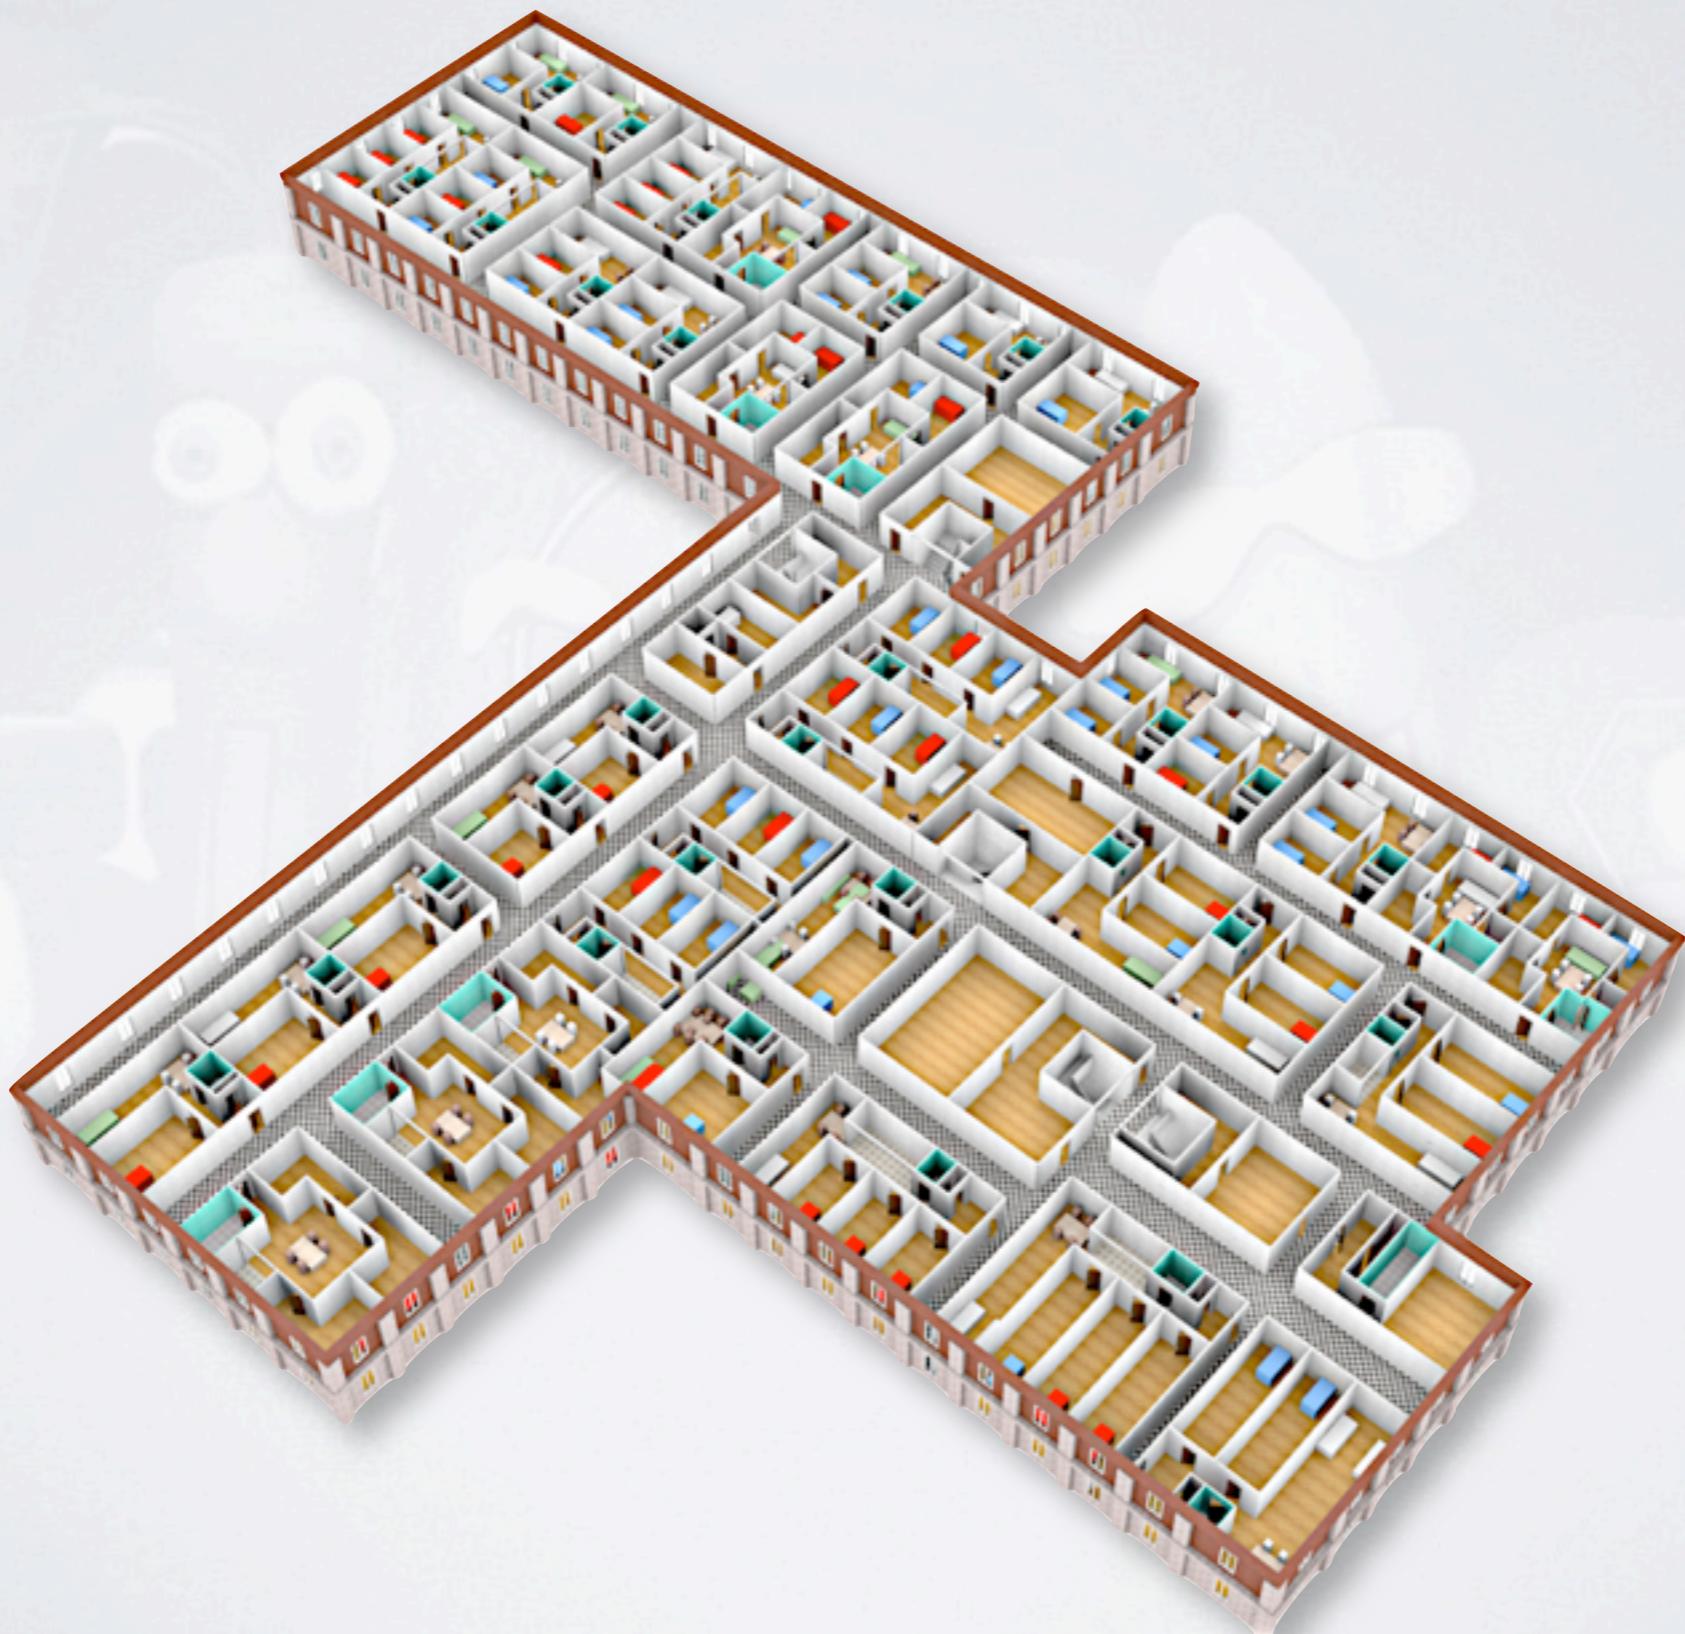

INTERIOR VARIATION

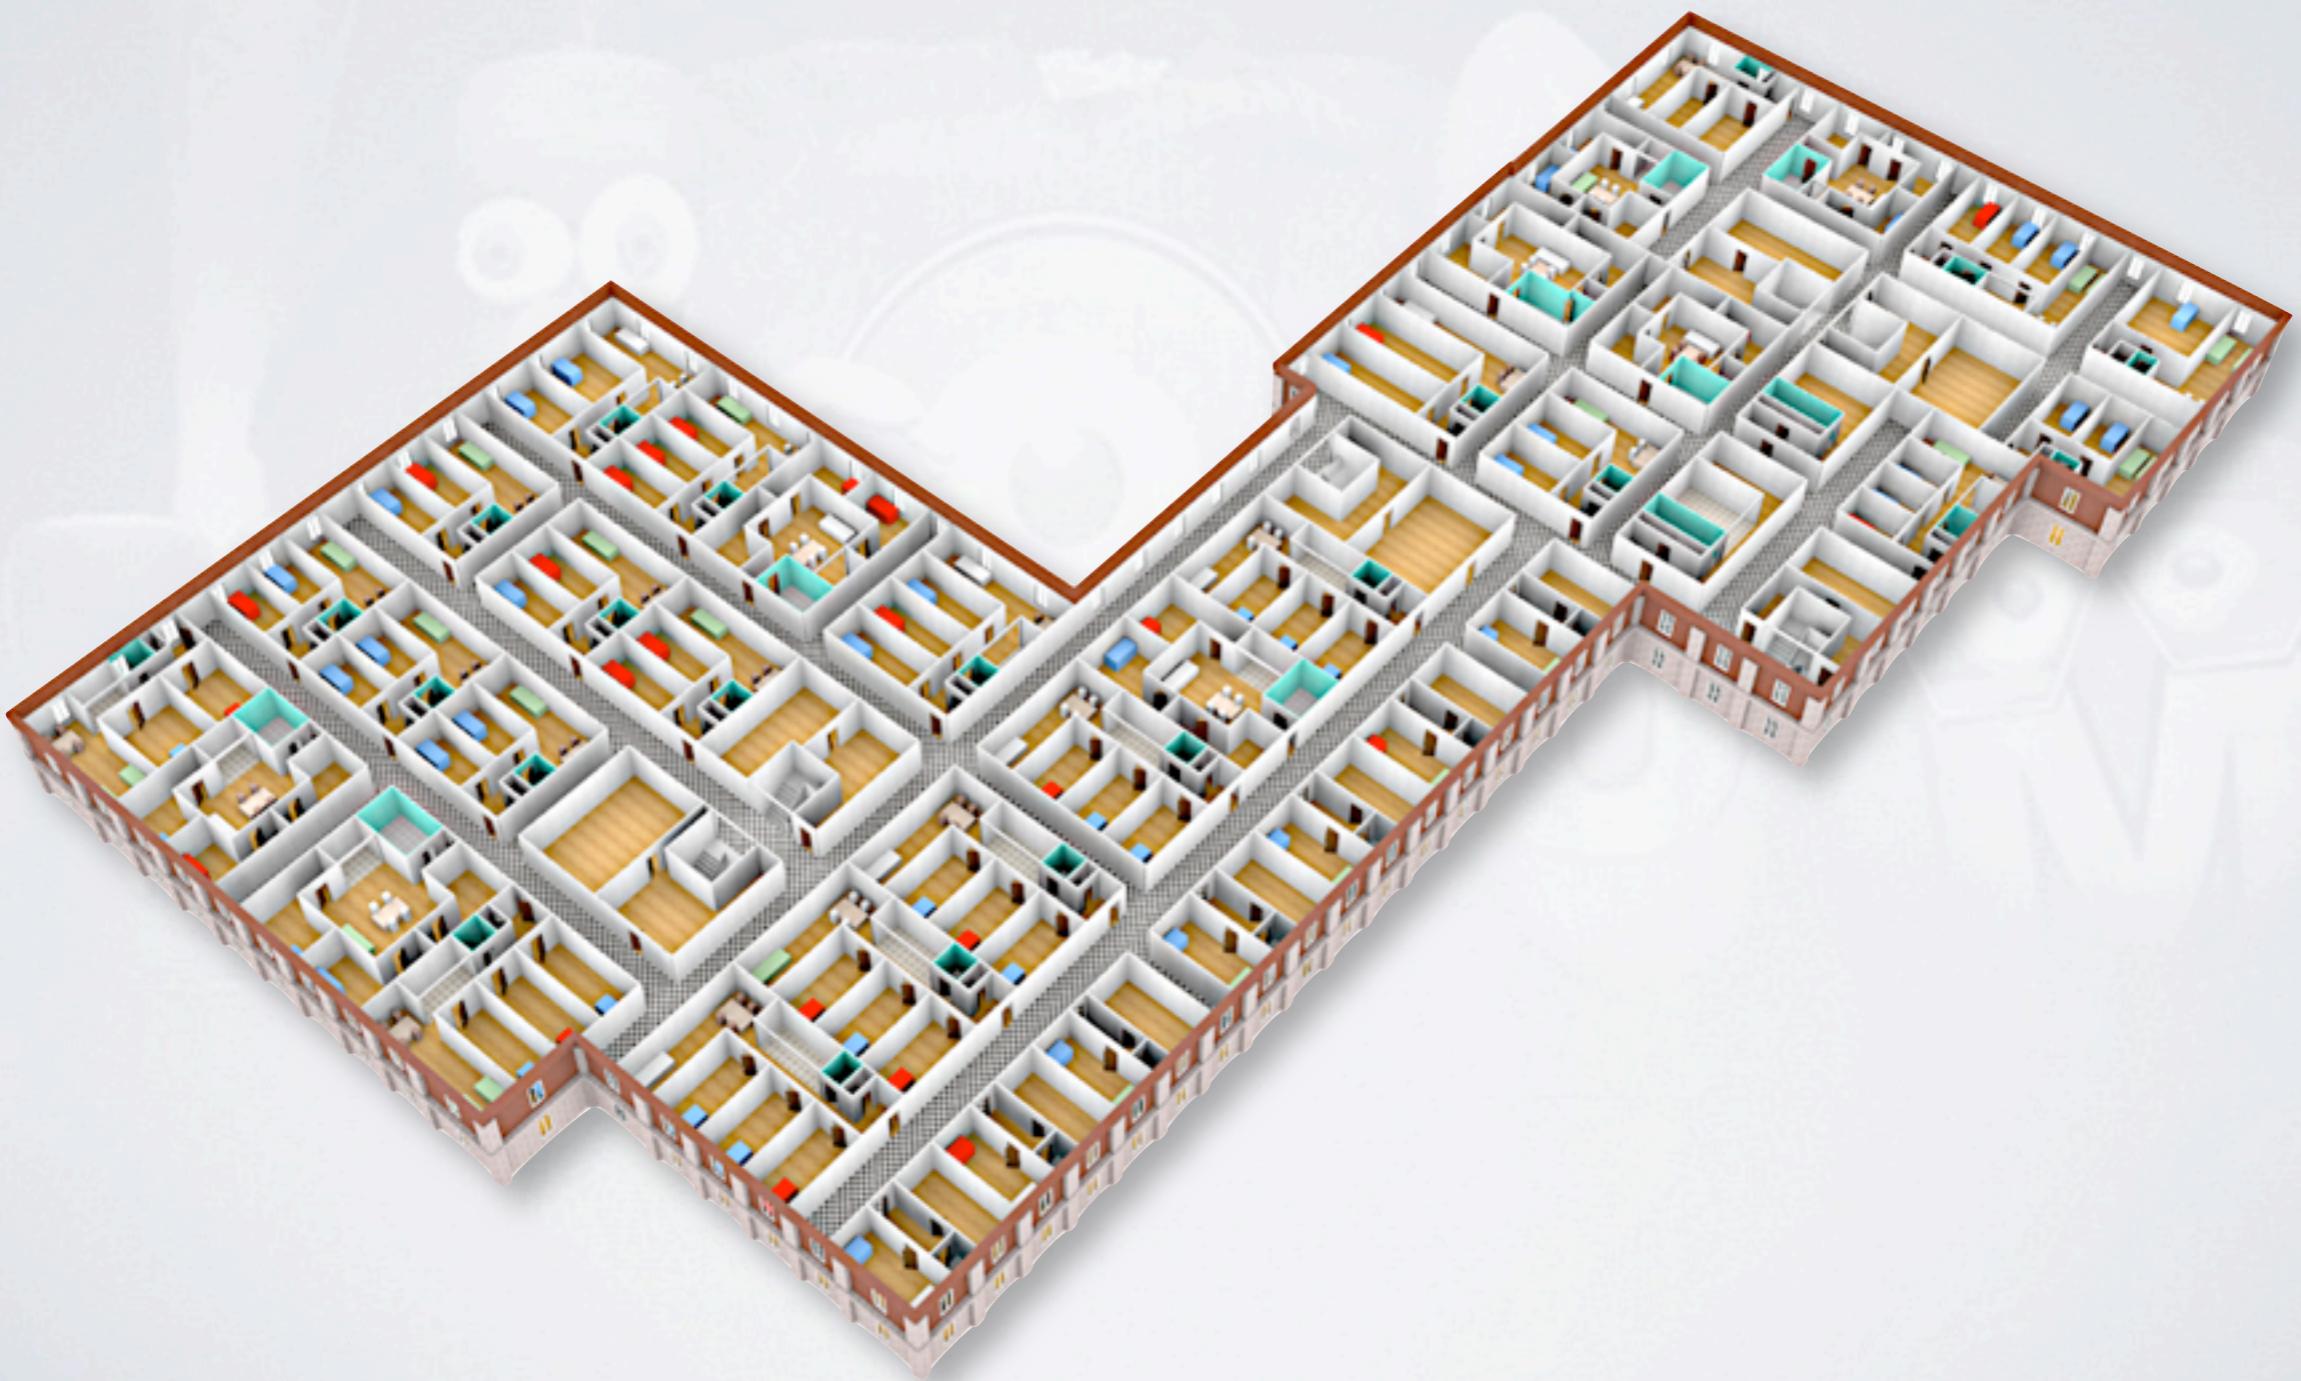

INTERIOR VARIATION

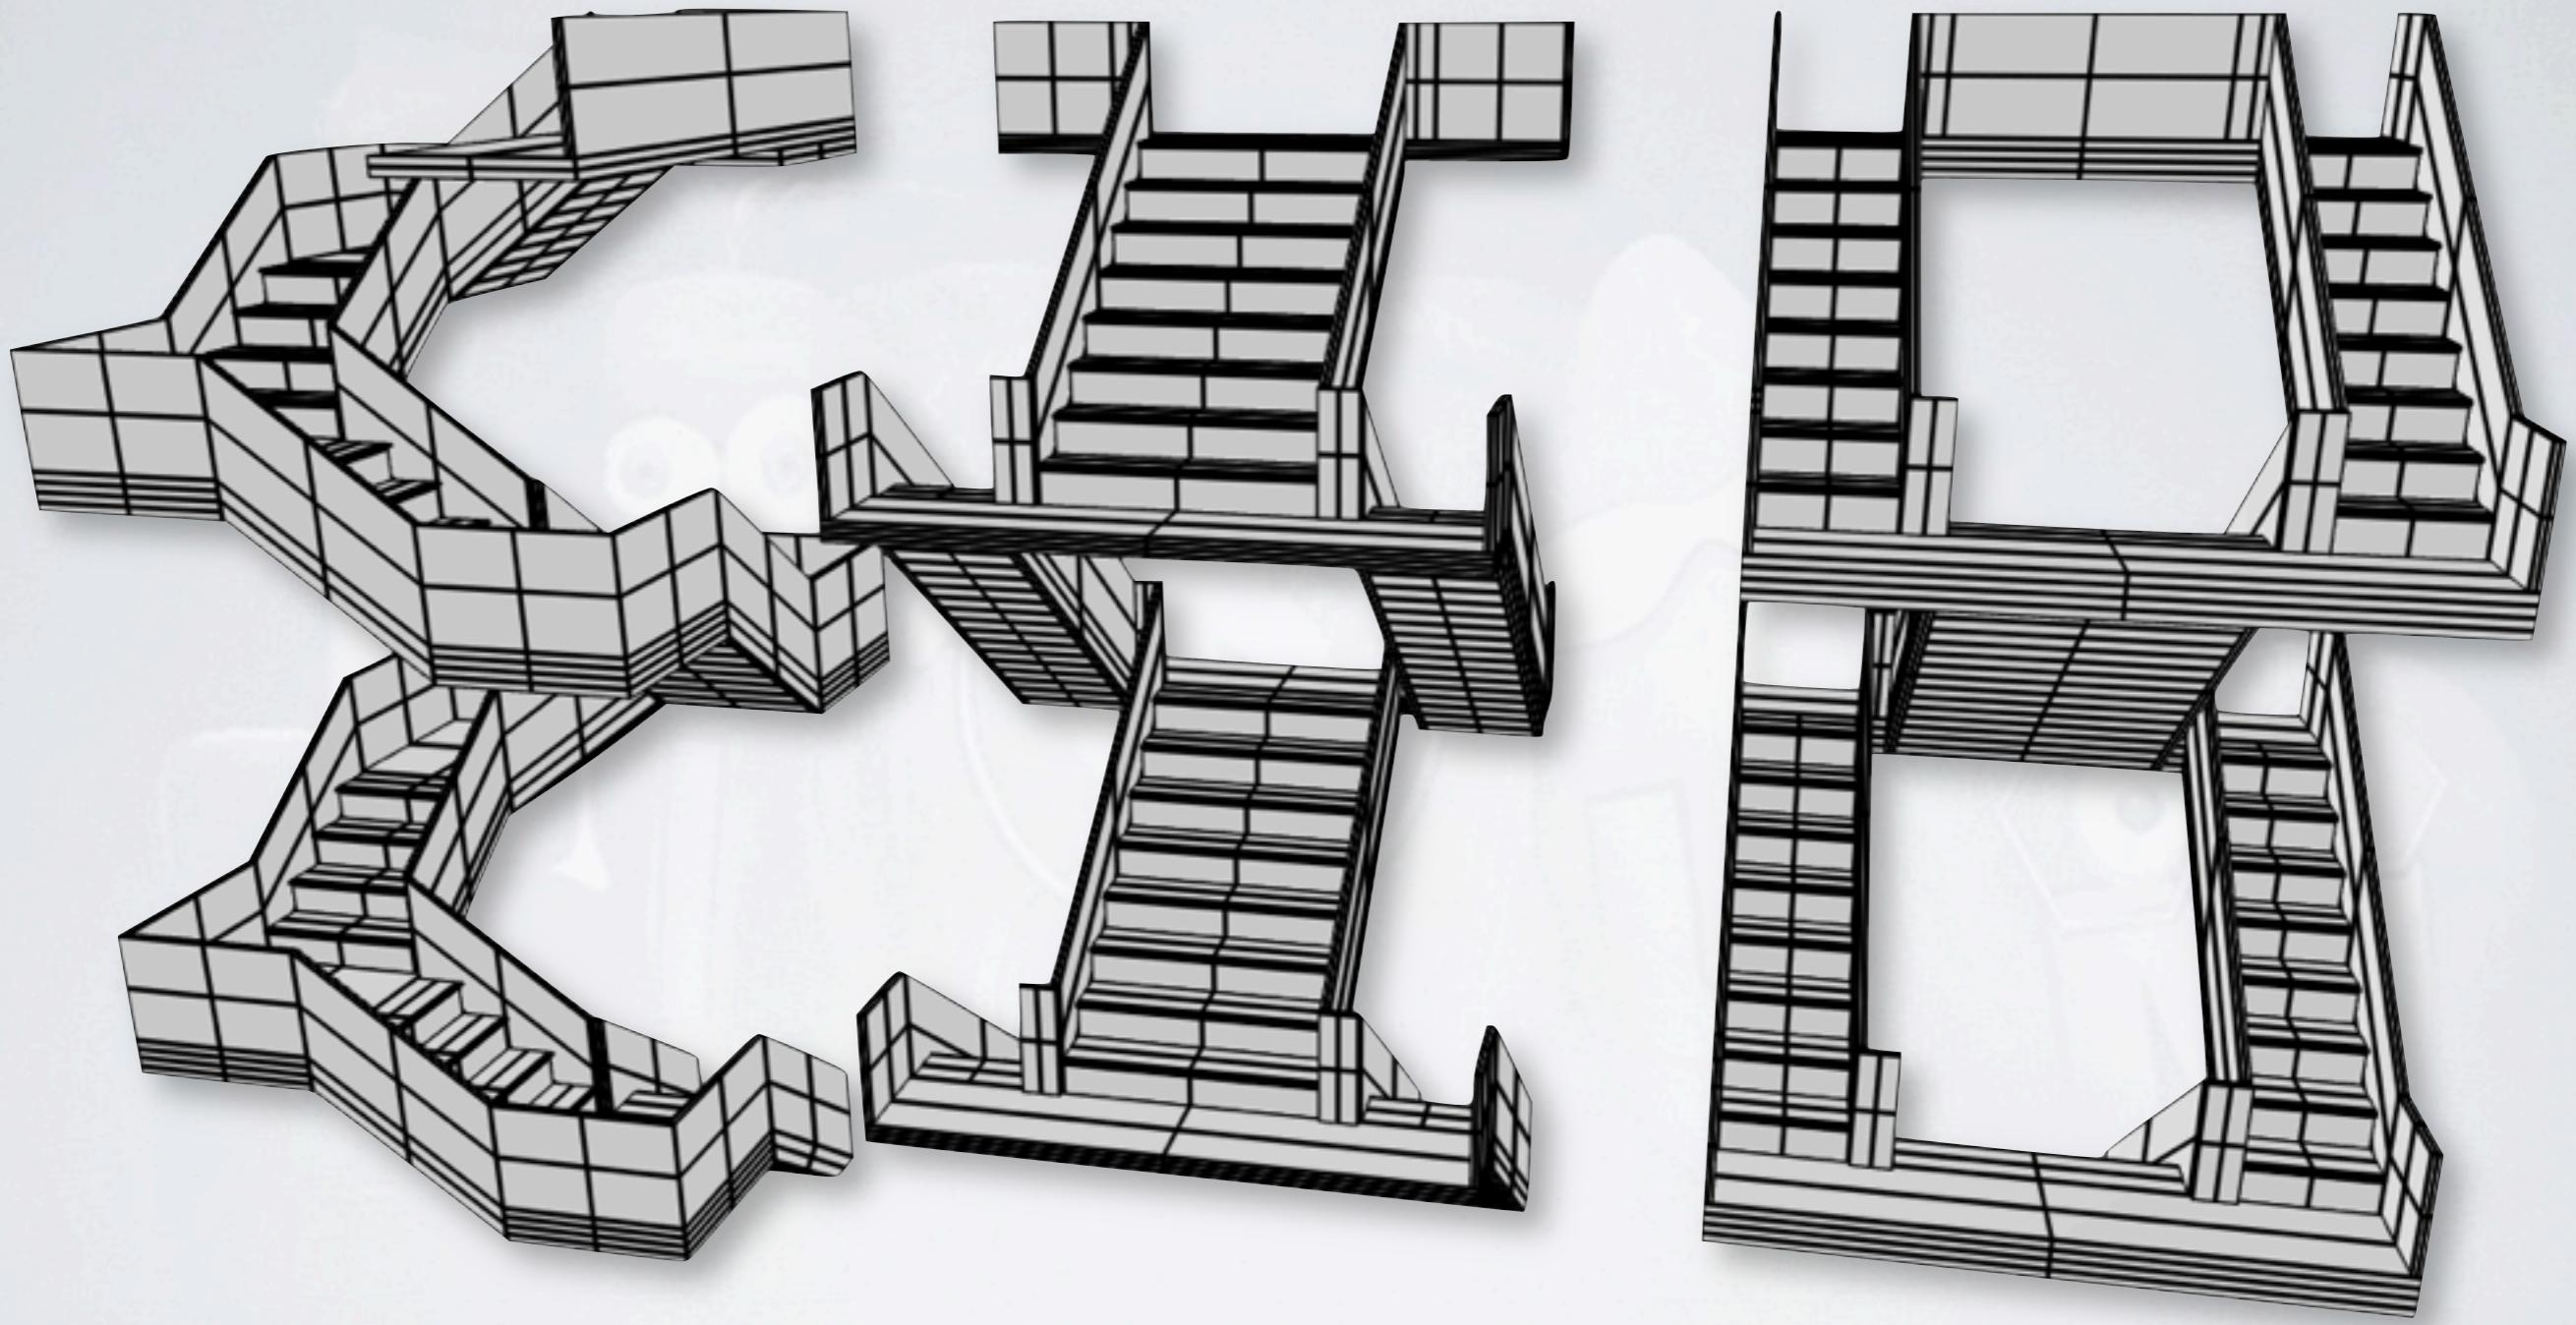

EXTERIOR VARIATION

EXTERIOR VARIATION

CONCLUSION

- Interiors and exteriors
- Programming environment
 - code reuse (libraries)
- Flexible and powerful
- Complex task

FUTURE WORK

- Optimization operation for high level space partitioning
- Higher level coding
 - interface
 - photos
- Lazy generation
